THEORIES OF HUMAN BEHAVIOUR IN SOCIAL WORK

How people manage to gain more control over their lives, either by themselves or with the help of others

- Power over one's life is an innate requirement of human psycho-social well-being. Powerless people will attempt to regain power (often in dysfunctional ways).

- Powerlessness is contra-indicated for psycho-social
- Power/powerlessness is behaviourally, emotionally psychologically and cognitively manifested.
- First, analyse where power and powerlessness lie in relation to the issue and events.
- Then work with the individual to apply knowledge and skills in functional way and work with other systems to respond appropriately.

How individuals develop cognitive functioning and learn through acting on their environment.

MAIN

FOCUS OF

THEORY

BEHAVIORISM &

SOCIAL LEARNING

THEORY

PRACTICE

- Imitation & reaction to stimulate and shape behavioral learning.

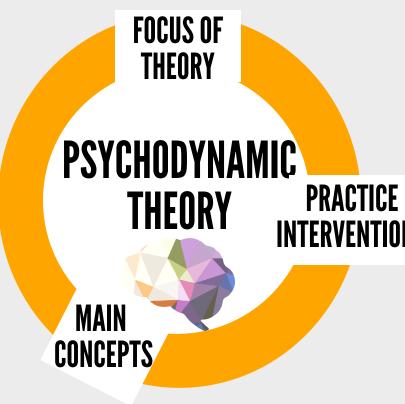

- Knowledge is constructed by children through physically and mentally acting on objects.
- Intelligence is an evolutionary, biological adaptation to CONCEPTS environment.
- Cognitive structures enable adaptation and organization.

- Time-limited, problem-focused interventions.
- Cognitive reframing of automatic thoughts about presenting problems to facilitate change.

How inner energies and external forces interact to impact emotional development.

How children go through a series of 4 key stages of cognitive development

Ego supportive treatment:

- Clarification, education, & support of adaptive functioning.

- Empathy & attention to affects and emotions.

- Understanding of ego defense mechanisms & **INTERVENTIONS** underscoring of ego strengths.

> - Establishing, building, & using the treatment relationship to facilitate change.

- Unconscious and conscious mental activity motivate human behaviour

- Ego-related functions mediate between individual and environment

- Ego defense mechanisms protect individuals from becoming overwhelmed by unacceptable impluses and threats

- Symptoms of depression and

respond to people around in a

more normal manner.

- Person begins to invest

or in planning the future.

active life in the present.

- Characterised by expressions or despair

generalised lack of interest in others and the

and futility, listlessness, withdrawal,

- Person often cannot be comforted.

distress abate. Person begins to

emotional energy in the present

- Final stage of grieving ends

when the person returns to an

CONTINUED...

- Innate human drive to form a primary attachment with another person(s).

- Attachment relationship is qualitatively different from all other relationships-emotive intensity.

- Types of attachment relationships: secure attachment, insecure ambivalent, insecure avoidance, insecure disorganized/disorientated.

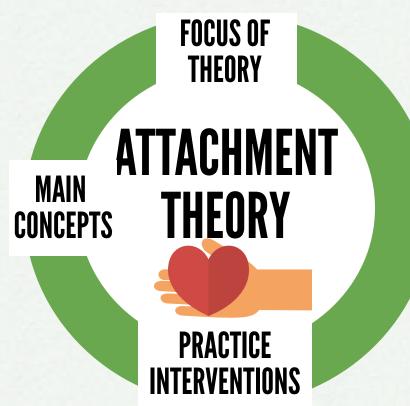

power in relation to human experiences.

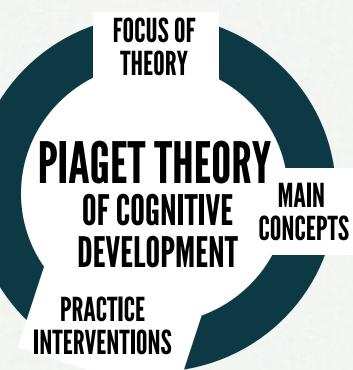

FOCUS OF

THEORY

Our ability to give and to receive love/compassion/empathy from others.

- Recognise that maltreated children are much more likely to exhibit insecure attachment patterns

- Stages of cognitive development: (1) sensori-motor, (2) pre operational, (3) concrete operational, (4) formal operational.

- Recognition that children's thinking process and conclusions are qualitatively different to those of most adults.

- Presence of a logical relationship between the 'wrong' answer children arrive at and the thinking process used – 'internal logic'.

- Recognise that the creation of knowledge and intelligence is an inherently active process.
- Provide a rich and supportive environment for the child to grow and learn.
- Peg lessons to the child's cognitive level

- Life is divided into 8 stages where a socio-developmental 'crisis' occurs.

Erikson's Stage Theory in its Final Version Conflict Resolution or "Virtue" Age Culmination in old age Infancy Basic trust vs. mistrust Hope Appreciation of interdependence and relatedness (0-1 year) Will Early childhood Autonomy vs. shame Acceptance of the cycle of life, from integration to (1-3 years) disintegration Initiative vs. guilt Purpose Play age Humor; empathy; resilience (3-6 years) Humility; acceptance of the course of one's life and School age Industry vs. Inferiority Competence (6-12 years) unfulfilled hopes Identity vs. Confusion Sense of complexity of life; merging of sensory, logical and aesthetic perception Adolescence Fidelity (12-19 years) Early adulthood Intimacy vs. Isolation Love Sense of the complexity of relationships; value of (20-25 years) tenderness and loving freely Care Adulthood Generativity vs. stagnation Caritas, caring for others, and agape, empathy and (26-64 years) concern Old age Wisdom Integrity vs. Despair Existential identity; a sense of integrity strong enough to withstand physical disintegration (65-death)

How our personality develops in a series of 8 stages.

	FOCUS OF Theory	
ERIKSON'S THEORY Main of Psychosocial Concepts development		
	PRACTICE Interventions	

- Apply stages of development to lifespan of the individual to understand them.

- Resolution of each 'crisis' stage enables the individual to move forward to the next stage.

- Completing each stage successfully ("mastery of a stage") helps in the development of ego identity.

- Person appears compliant and disconnected from event, as if the loss was of little significance. Person may be stunned and robot-like.

- Person may deny the event and/or feelings accompanying the event. Little emotional expression.
